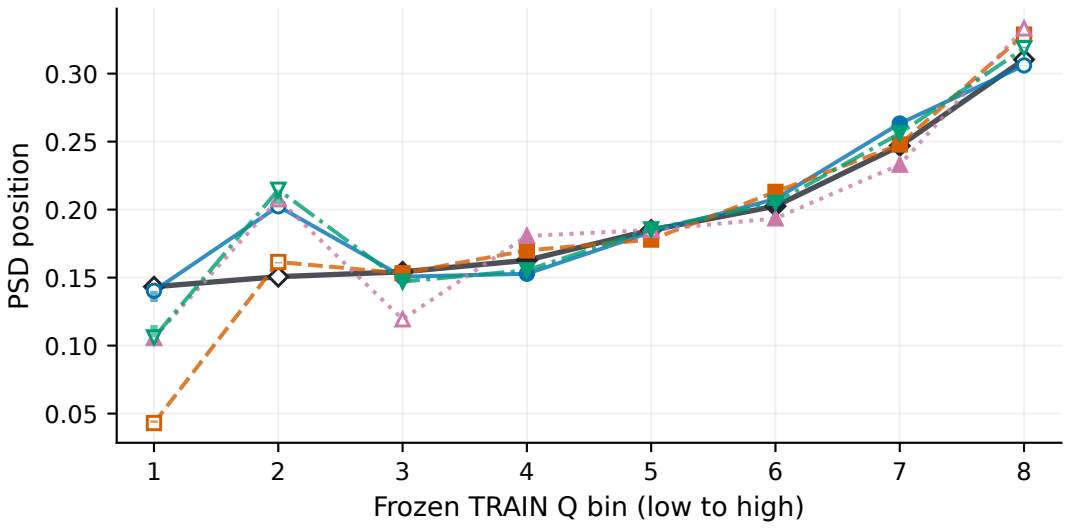
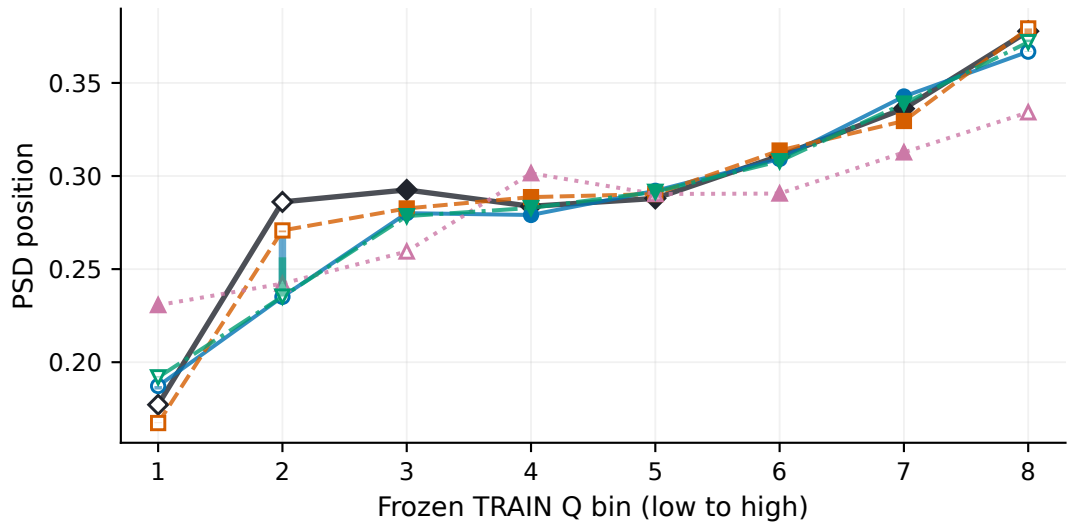
Conditional PSD: frozen component positions and original widths

REAL · Full · Deterministic U-Net · Simple · Full / uniform population

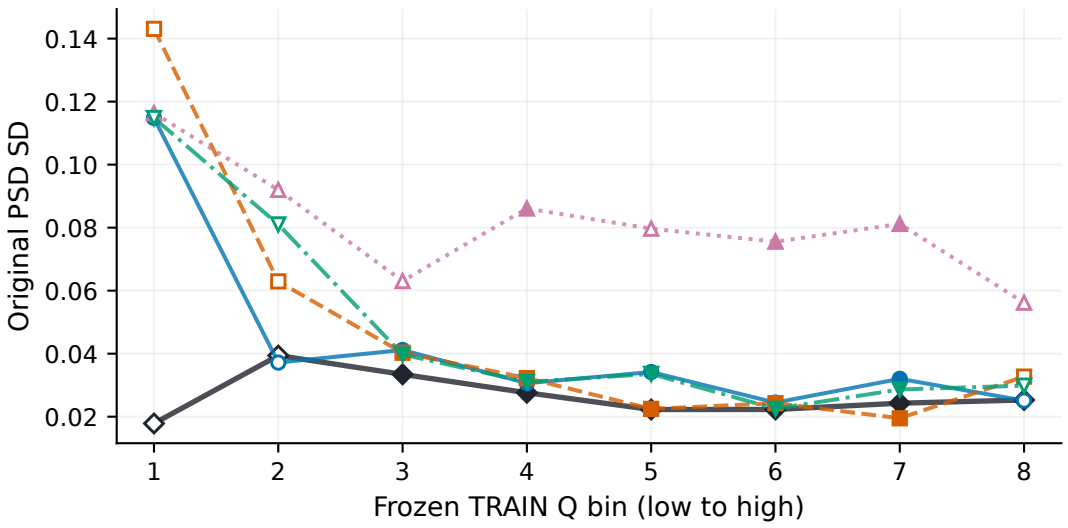
a Lower PSD component position



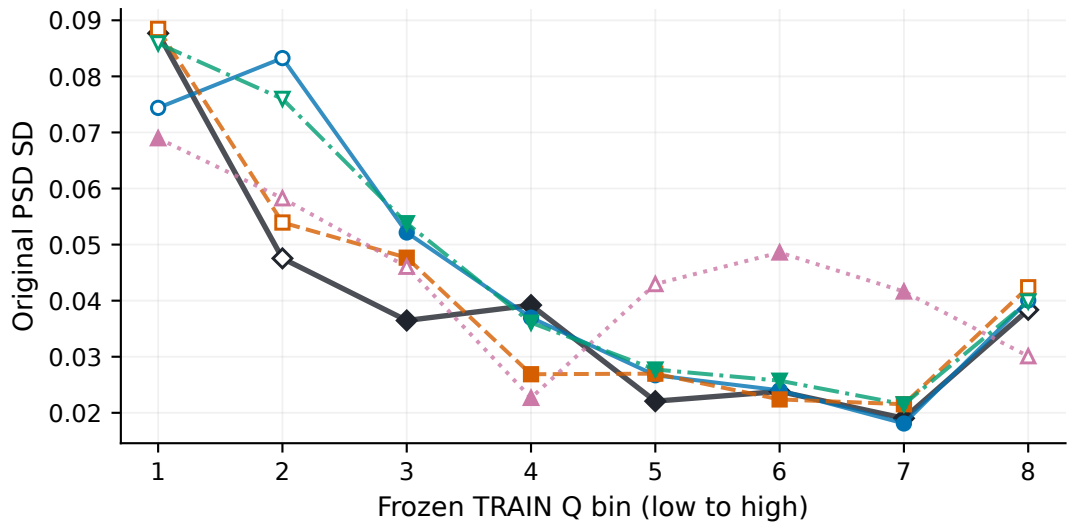
b Upper PSD component position



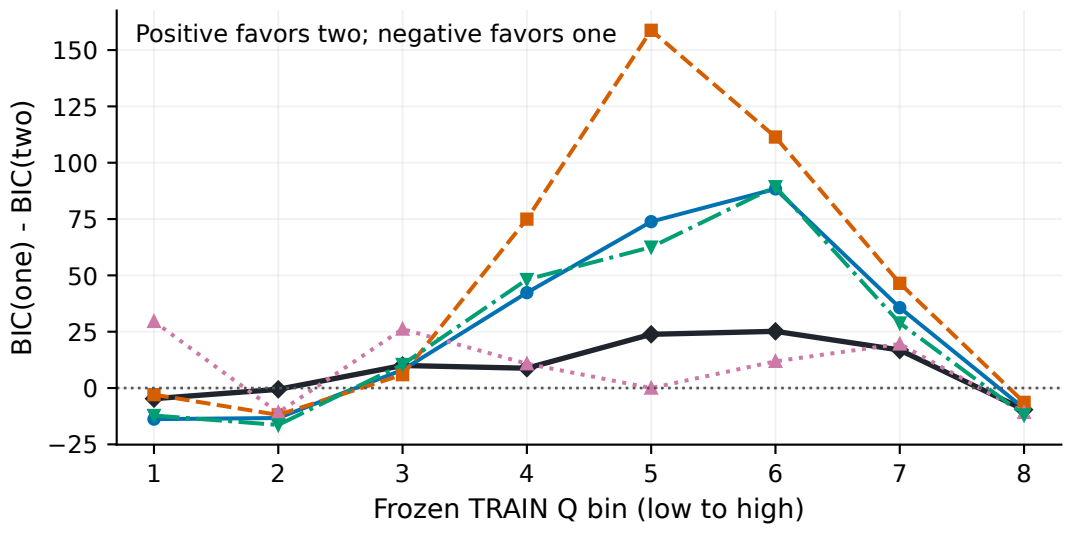
c Lower PSD component original width



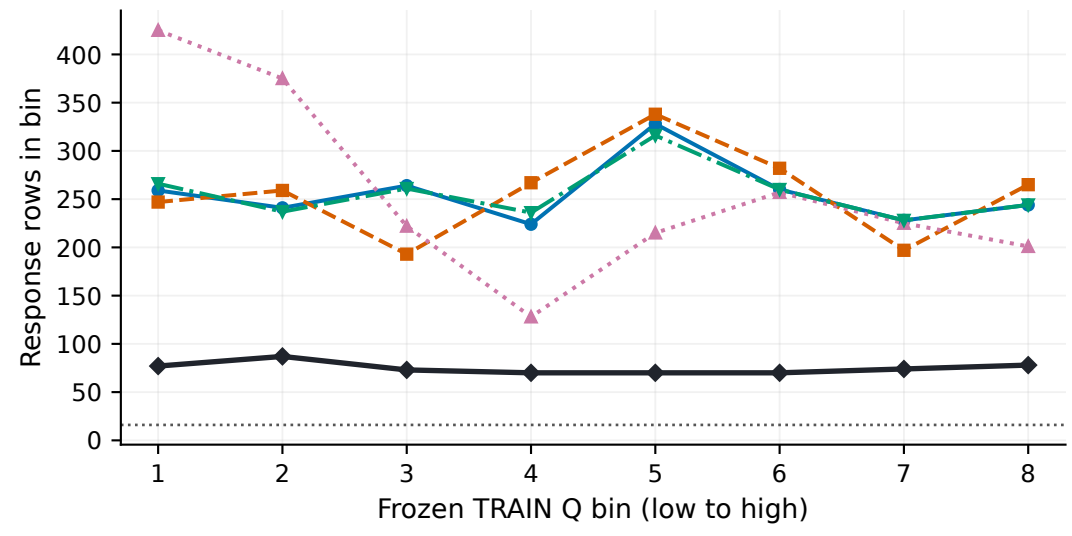
d Upper PSD component original width



e Recorded model-selection ambiguity



f Existing fit support



Open markers: recorded one-Gaussian BIC preference or incomplete convergence across initializations; components are not particle labels.
Widths are frozen original PSD SDs. Counts are response rows (generated draws are clustered by parent); the original minimum fit support is 16.
No peaks were refitted here and no new pass/fail threshold was introduced.
