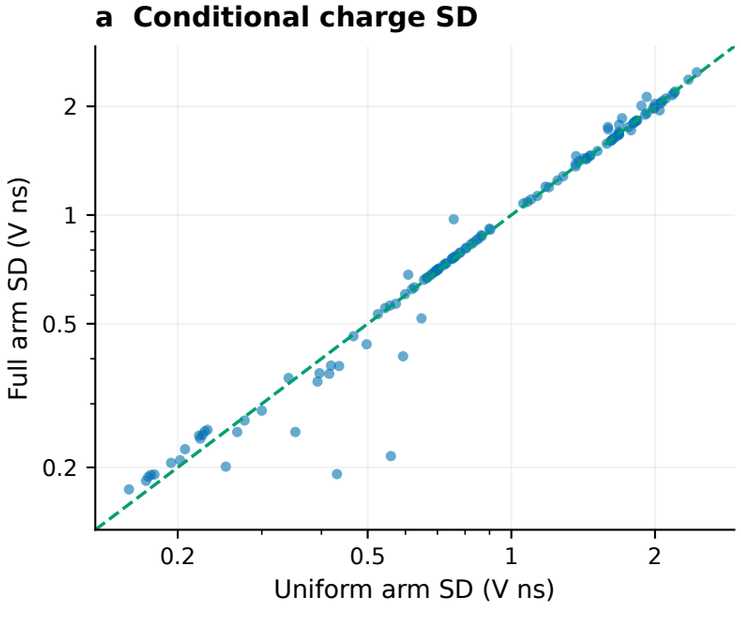
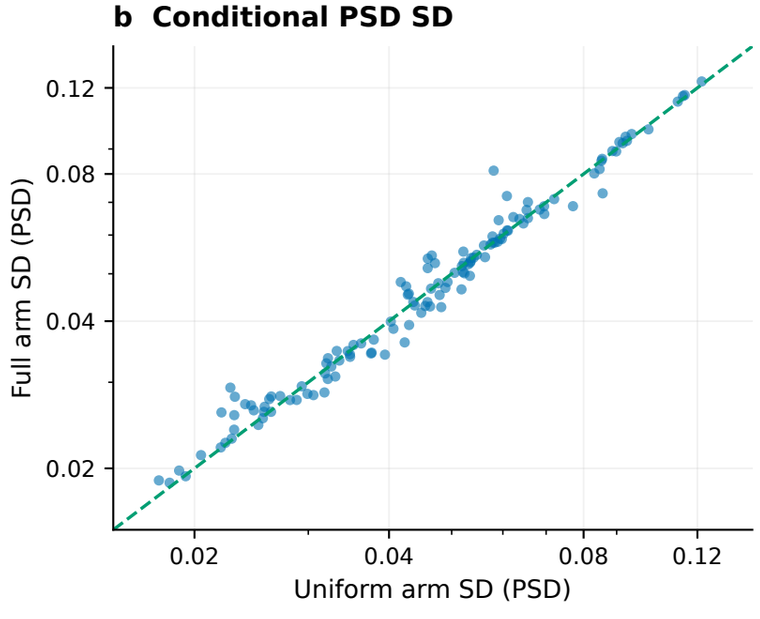
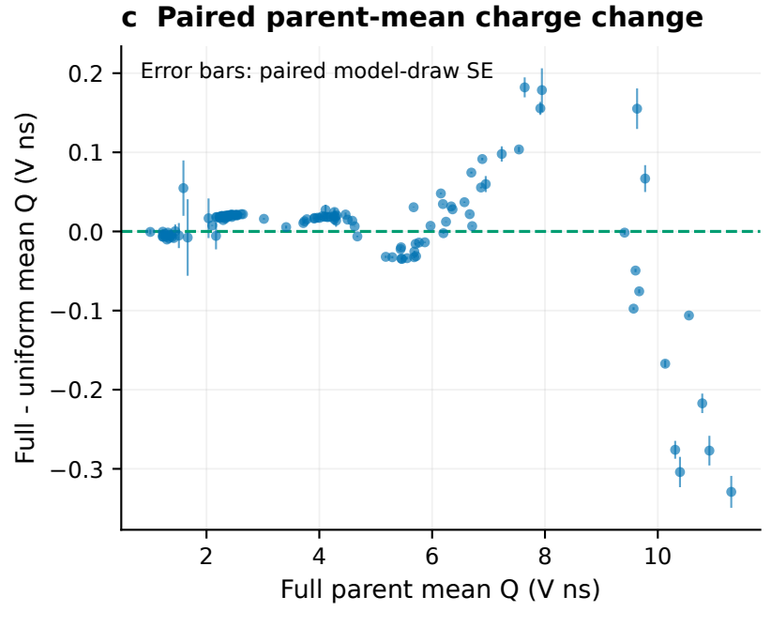
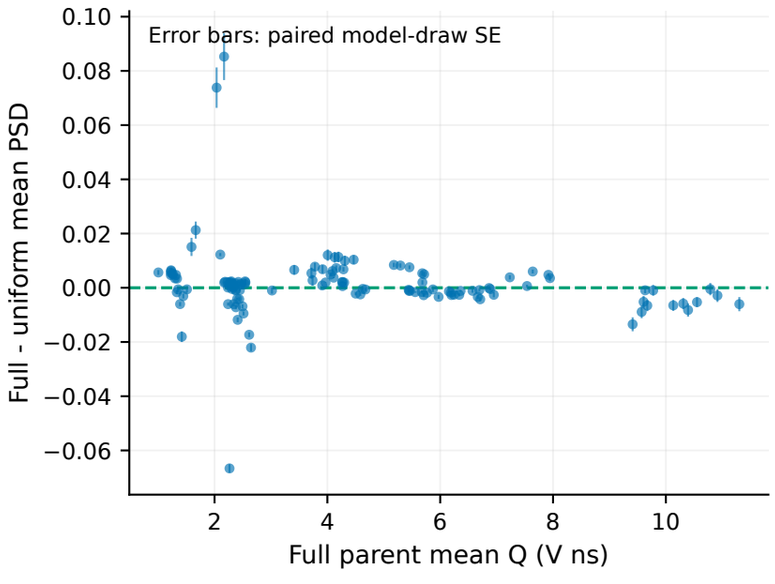
Full response sensitivity to the population-weight setting

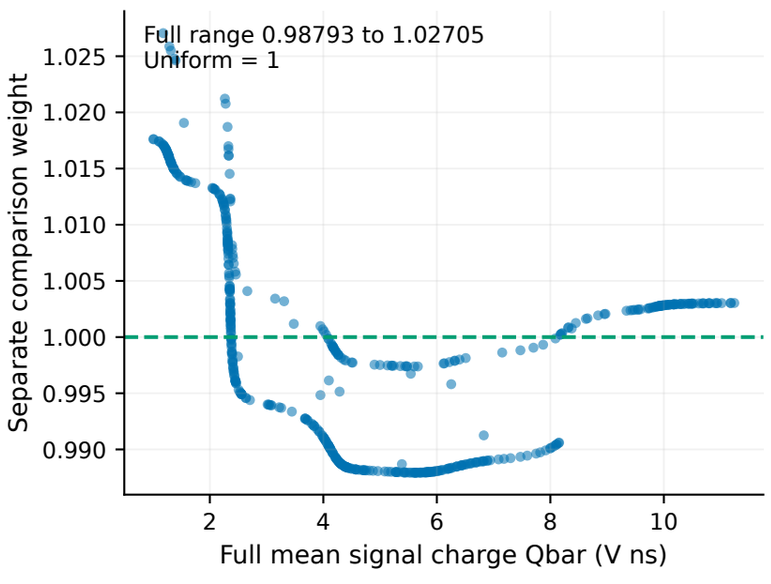
128 common SOURCE parents x 64 saved draws; same training seed, separately trained full and uniform arms

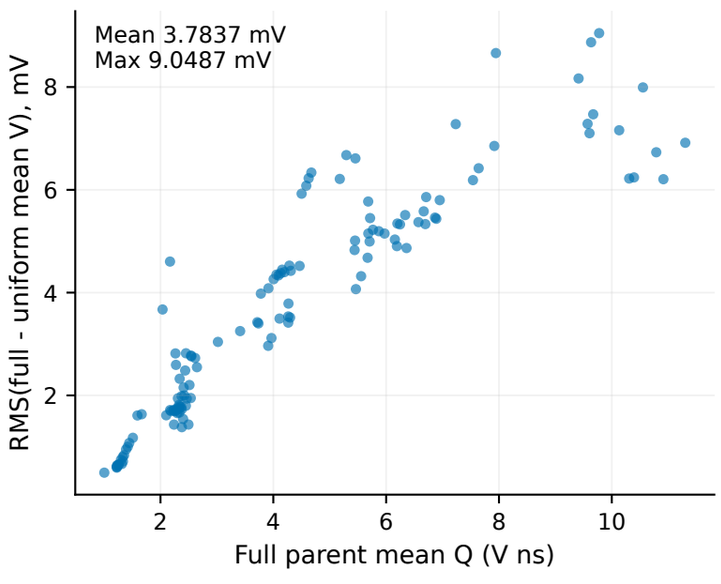












Conditional SDs and SEs describe model draws, not repeated physical measurements. Small overall Q/PSD mean differences do not prove response stability.
Full: 2/8192 repeated draws have nonzero pre-ADC saturation (the 2048-draw marginal snapshot has none). All saved saturation values are retained.
