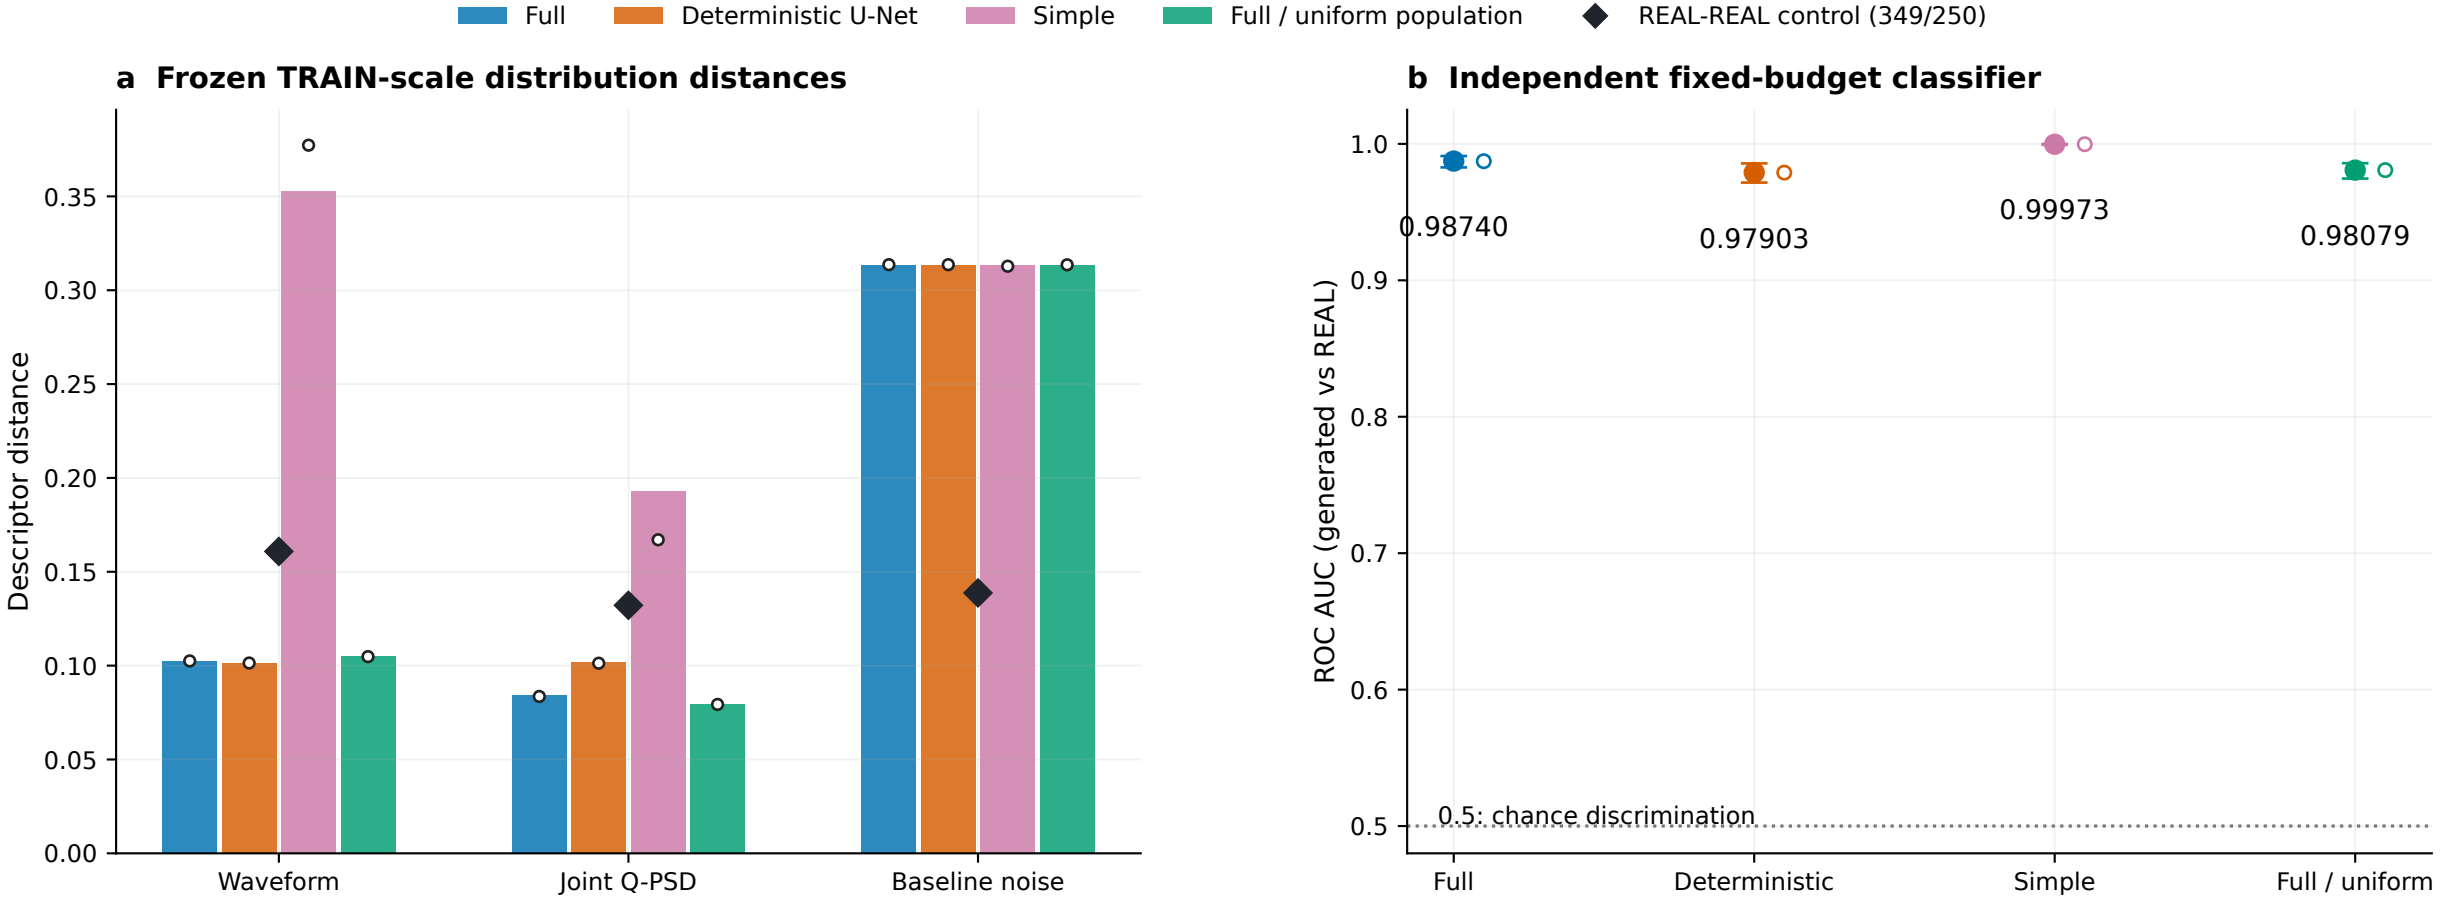
Endpoint descriptor distances and independent domain separability



Solid bars/points: raw populations; open dots: saved comparison weights. AUC error bars: frozen 95% original-group/parent bootstrap intervals.
Distance control sample sizes differ: REAL-REAL 349/250 versus generated/REAL 2048/599; its values are descriptive, not direct pass thresholds.
AUC test: 205 SOURCE parents x 4 = 820 responses / 250 REAL rows (5 groups) from one acquisition. Low projected distances do not establish response recovery.
